

OneSpread

AI-assisted options decisions
with an independent execution gate.

Evidence. Proposal. Veto. Order state.

Paper-only prototype • SPY debit verticals • MIT source

Prices can change while the model thinks.

39.16 s

median response in the selected
GLM-5 hosted configuration

Refresh the evidence

Re-read quotes, context, and account state after inference.

Keep the decision inspectable

Record the proposal and the exact reason execution passed or stopped.

Ten synthetic integration cases, one attempt each. This is not a trading-performance benchmark.

A proposal must survive fresh evidence.

- | | | |
|----|------------------|--|
| 01 | Read | Official Alpaca CLI reads the account, SPY options, IEX bars, and news. |
| 02 | Propose | GLM-5 cites supplied evidence and selects a candidate or WAIT. |
| 03 | Recheck | Code refreshes inputs and applies price, exposure, and calendar gates. |
| 04 | Reconcile | Commit intent, submit in paper mode, and track broker state to confirmed flatness. |

The model has no broker tools. The journal records uncertainty before another action.

One spread, explicit premium limits.

SPY debit verticals

Bull call or bear put
7–14 days to expiry
Five-point strike width
One contract per leg

\$300

maximum entry premium before costs

Synthetic \$2.00 debit $\times$ 100. Expiration loss \$200, profit cap \$300.
Excludes costs, early assignment, and execution complications.

A reproducible demo with clear limits.

EXERCISED

Alpaca read access
Paid Featherless inference
22 offline tests
Three synthetic engine replays

STILL TO VERIFY

Actual paper submission and fills
A complete broker round trip
Executable-price behavior
Out-of-sample strategy value

Hosted replay uses a scripted model and fake broker.
Basic options quotes are indicative. No measured P&L or alpha claim.

Inspect the proposal. Understand the veto.

Try the replay

Clone the public source and open the local dashboard without keys.

Verify the next boundary

Run a monitored paper round trip, then validate execution data and research the strategy out of sample.
